MVP Readiness

1. EXECUTIVE SUMMARY

RoutelQ Nigeria solves a structurally broken navigation and logistics accountability problem in the Nigerian market. GPS tools built for Western street-naming conventions fail entirely in Lagos, where navigation is landmark-based and informal. The result is compounding pain across three user groups: dispatch riders who get lost, vendors who cannot track their packages, and end customers who receive late or lost deliveries. The dispatcher accountability angle — live location tracking to catch dishonest riders — is an independently monetisable B2B hook with immediate willingness to pay from vendors.

Startup	RoutelQ Nigeria — Landmark Navigation + Dispatch Accountability
Problem	GPS tools don't reflect Nigerian landmark-based navigation; dispatchers lie about location with no accountability
Target Users	Lagos dispatch riders, SME vendors (Instagram/e-commerce), ride-hailing drivers
Geography	Lagos Phase 1 → Abuja → Port Harcourt
Stage	Idea — no code written yet
Key Insight	Dispatcher accountability is a B2B revenue hook vendors will pay for today
MVP Focus	Landmark-based address sharing + live dispatcher location for vendors

2. IDEAL CUSTOMER PROFILE (ICP)

ICP A — Lagos SME Vendor (Primary Revenue Driver)

Business type	Instagram fashion seller, e-commerce merchant, food brand — 20 to 200 deliveries per day
Location	Yaba, Surulere, Ajah, Lekki, Ikeja (Lagos)
Tools today	WhatsApp coordination, manual phone calls, zero tracking dashboard
Primary pain	Cannot verify dispatcher location or confirm delivery — costs real money daily
Willingness to pay	HIGH — one lost package pays for months of subscription
Decision maker	Business owner directly — no procurement gatekeeping
Where to find	Instagram DMs, Lagos SME Facebook groups, Paystack merchant network, Jumia vendor base

ICP B — Professional Dispatch Rider (Network Growth Driver)

Profile	Full-time Lagos dispatch rider serving 3 to 5 vendors daily, Android mid-range phone
Primary pain	Gets lost in estates and unfamiliar areas; burns fuel and time calling customers for directions
Navigation today	Google Maps (unreliable), asking passersby, calling vendors — wastes 30 to 90 mins per delivery
Willingness to pay	MEDIUM-LOW for navigation alone; HIGH if app brings more job offers
Key hook	"Find any Lagos address without calling the customer three times"
Connectivity	Data-conscious — app must be lightweight, offline-capable in Phase 2

3. BUYER PERSONAS

	Vendor Vivian	Rider Rasheed
Age	28–38	22–30
Gender	Female (majority of Lagos SME vendors)	Male
Location	Yaba / Surulere / Ajah	All across Lagos — Mainland & Island
Daily volume	50–80 deliveries dispatched	10–20 deliveries completed
Biggest frustration	Dispatcher lies about location; customer blames her	Google Maps puts him in wrong place every day
Quote	"My dispatcher says he's on the way for 2 hours. My customer is angry. I am angry."	"Sometimes the address they give me, Google Maps just puts me somewhere wrong."
Buying trigger	One more lost package or bad customer review	One more delivery where he wastes 45 mins lost
Budget	N5,000–N15,000/month	Free tier or N500–N2,000/month
Success looks like	Dashboard showing rider location + delivery confirmed	Navigate to any Lagos address without a single phone call

4. TOP 10 CUSTOMER PAIN POINTS

#	Pain Point	Who	Severity	Financial Impact
1	Dispatcher claims to be en route but has not moved	Vendor	10/10	Lost packages, refunds, customer churn
2	Google Maps shows wrong name for Nigerian streets/estates	All users	9/10	Failed deliveries, wasted fuel, rider calls
3	Rider spends 30–90 mins finding unfamiliar estate	Rider	9/10	Fewer deliveries per day = lower earnings
4	No proof of delivery — customer disputes receipt	Vendor	8/10	Refund disputes, reputational damage
5	Vendor has zero visibility on live package location	Vendor	9/10	Anxiety, constant phone calls, poor CX
6	End customer has no order tracking — calls vendor 5x	Vendor + Customer	7/10	Vendor time wasted, customer frustration
7	New rider doesn't know Lagos routes — high error rate	Rider	8/10	High early churn, bad first impressions
8	Multi-drop routing is unoptimised — wrong delivery order	Rider	7/10	Excess fuel spend, slower daily throughput
9	Dispatcher 'branches' — makes unauthorised stops	Vendor	8/10	SLA breaches, vendor-customer trust breakdown
10	Low connectivity in some Lagos areas kills live tracking	Rider	7/10	App fails precisely when most needed

5. CUSTOMER JOURNEY

Stage	Vendor Vivian	Rider Rasheed	RouteIQ Touchpoint
Awareness	Sees post about a vendor losing a package to a dishonest rider	Fellow rider mentions app finds any Lagos address	Content: 'The real cost of your dispatcher lying' / Word of mouth
Consideration	Searches for dispatch tracking; finds RouteIQ landing page	Downloads app; checks if his delivery zones are covered	Demo video showing live rider dot on vendor dashboard; zone coverage map
Purchase / Activation	Signs up for 14-day free trial; adds first rider	Free signup; enters his LGA and usual delivery zones	Onboarding flow: one rider, one test delivery — first wow moment
Retention	Uses dashboard for all daily dispatches; checks weekly report	Opens app every morning; navigates to new estates without calling	Weekly delivery summary email; push alerts; verified rider badge
Advocacy	Recommends to vendor friends in WhatsApp group	Tags himself as available rider; gets more jobs via app	Referral: 1 free month per vendor signup; Rider leaderboard

6. KEY CUSTOMER OBJECTIONS & RESPONSES

Objection	Persona	Response
"My riders won't use it"	Vendor	Flip the pitch: riders adopt it for navigation first. Vendor tracking comes as a bonus once riders are in.
"It's too expensive"	Vendor	One recovered package pays for 6 months of subscription. Lead with ROI, not features.
"Google Maps is free"	Rider	Google Maps doesn't know your customer's compound. RouteIQ does. Demo the estate navigation live.
"I don't trust the data yet"	Both	Offer 14-day free trial with no card required. Build trust before asking for money.
"My area might not be covered"	Rider	Launch waitlist with zone tracker. Users can see their area is queued and get notified at launch.
"I have no data / poor signal"	Rider	Offline mode is on the roadmap. Partner with MTN/Airtel for data bundle deals at signup.
"Riders will resent being tracked"	Vendor	Frame to riders as a navigation tool. Tracking is vendor-side and optional to disclose initially.

7. KEY BUYING TRIGGERS

Trigger	Persona	Sales Message
Dispatcher gets lost; package returned or lost	Vendor	"Never lose a package to a lazy rider again."
Customer leaves bad review citing delivery delay	Vendor	Show proof-of-delivery feature — photo + timestamp.
Rider wastes 45+ mins finding one estate	Rider	Demo: 'find any Lagos address without calling the customer.'
Vendor friend recommends the tool in WhatsApp group	Vendor	Referral programme — 1 free month per successful referral.
New rider starting out, doesn't know Lagos	Rider	Free tier with Lagos route learning mode. Zero barrier.
Vendor loses repeat customer due to failed delivery	Vendor	"Your dispatcher cost you a customer. Here's how to never let that happen again."

8. MVP RECOMMENDATION

What to build first

- Landmark-based address sharing: let a vendor create a delivery address using Lagos landmarks ("after Access Bank Yaba, blue gate") and share it as a link with their rider
- Live rider location pin: vendor opens the link and sees their rider's GPS dot moving in real time — no login required for vendor
- Delivery confirmation: rider taps 'Delivered' + uploads photo — vendor gets a timestamped notification
- Lightweight Android app for riders: offline-tolerant, under 15MB, low data usage

What NOT to build yet

- Full mapping engine — use OpenStreetMap as base layer; crowd-source landmark layer progressively
- iOS app — Android is 90%+ of the Lagos dispatch rider market
- Multi-city support — Lagos only until product-market fit is confirmed
- Payment integration, ratings system, or marketplace features — Phase 2
- Rider job-matching / aggregator layer — only after core navigation is sticky

MVP Success Metrics (Day 30–60)

Metric	Target	Signal Meaning
User interviews completed	20+	Minimum research base to build with confidence
Vendors expressing willingness to pay	5+	Revenue validation — green light to build payment layer
Waitlist signups in 72 hours of launch	100+	Demand signal worth building for
Riders who complete 3+ deliveries in app	50+	Activation and habit formation confirmed
Vendor retention at Day 30	60%+	Product is solving real pain, not just curiosity downloads
Average deliveries tracked per vendor/week	15+	Core use case is embedded in daily workflow

9. MoSCoW PRIORITISATION

Priority	Feature	Rationale
MUST HAVE	Landmark-based address creation & sharing	Core job-to-be-done — without this, nothing works
MUST HAVE	Live rider GPS tracking for vendors	The B2B accountability hook — primary revenue driver
MUST HAVE	Delivery confirmation (photo + timestamp)	Eliminates disputes — vendors' biggest secondary pain
MUST HAVE	Lightweight Android app for riders	90%+ of target riders are on Android
SHOULD HAVE	Vendor dashboard (all active riders in one view)	Scales from 1 to 10+ riders per vendor
SHOULD HAVE	Push notifications (pickup confirmed, delivery done)	Reduces vendor phone calls dramatically
SHOULD HAVE	Offline map caching for common Lagos zones	Solves low-connectivity problem for riders

COULD HAVE	Rider rating and performance scores for vendors	Useful but not needed at MVP stage
COULD HAVE	Multi-drop route optimisation	Phase 2 feature — adds complexity, not core to MVP
COULD HAVE	Customer-facing order tracking link	Nice to have; vendor-to-customer transparency layer
WON'T HAVE	iOS app	Not the dispatch rider's platform — defer to Phase 2
WON'T HAVE	Rider job marketplace / aggregator	Different product — builds on top of core, not within it
WON'T HAVE	Multi-city support at launch	Lagos focus is a strategic choice, not a limitation
WON'T HAVE	Full custom mapping engine	Unnecessary at MVP — OSM base layer is sufficient

10. PRICING HYPOTHESIS

Tier	Target User	Price	What They Get	Rationale
Free	Dispatch riders	N0/month	Navigation + landmark routing, basic address sharing	Rider adoption drives vendor value — free is the wedge
Starter	SME vendors (1–3 riders)	N4,999/month	Live rider tracking, delivery confirmation, 3 riders	Below N5K psychological threshold; impulse buy range
Growth	Active vendors (4–10 riders)	N12,999/month	All Starter + vendor dashboard, weekly reports, 10 riders	Matches scale of mid-size Lagos vendor operations
Pro	Logistics SMEs (10+ riders)	N29,999/month	Unlimited riders, API access, priority support	For companies managing their own rider fleet

Pricing must be validated in user interviews before any payment layer is built. Start with 100% free during Beta — charge only after 60 days of confirmed usage.

11. TOP 5 RISKS

Risk	Prob	Impact	Level	Mitigation
Map data quality is too poor at launch — missing streets, wrong names	HIGH	HIGH	CRITICAL	Partner with OpenStreetMap Nigeria contributors; run pre-launch crowd-sourcing sprint with 50 riders
Dispatch riders resist location tracking (privacy concerns)	MEDIUM	HIGH	HIGH	Position app as navigation tool first — tracking is vendor-side. Riders never see a 'you are being tracked' message
Vendors unwilling to pay — 'I'll just keep calling'	MEDIUM	HIGH	HIGH	Freemium model; only charge after proof of value. Target vendors who have already lost a package this month
Solo founder bandwidth — too much to build alone	HIGH	HIGH	CRITICAL	Ruthless MVP scope; 7-day build sprint; recruit 1 part-time developer or designer post-validation
Google Maps improves Nigeria coverage before launch	LOW	HIGH	MEDIUM	Google has no incentive for hyperlocal Lagos landmark data. Your data network effect compounds with every user

12. 30-DAY MVP PLAN

Days	Action	Output	Priority
1–3	Map your problem: list every GPS/dispatch failure you or your network has personally experienced	Problem statement doc	CRITICAL
4–7	10 user interviews with Lagos dispatch riders (find them at Yaba, Ikeja, Ajah hubs — morning pickups)	Interview notes + pain ranking	CRITICAL
8–10	10 user interviews with Lagos SME vendors (Instagram DMs, SME WhatsApp groups)	Willingness-to-pay signals	CRITICAL
11–12	Synthesise findings: lock down the one MVP feature (landmark sharing vs live tracking vs both)	MVP scope decision document	HIGH
13–15	Explore OpenStreetMap Nigeria data — identify 3 OSM contributors to speak with	Data strategy decision	HIGH

16–20	Build MVP v0: landmark-based address sharing + live rider pin (no login needed for vendor)	Working prototype on Android	HIGH
21–23	Put prototype in hands of 5 riders + 3 vendors from your interview pool	Qualitative feedback session	CRITICAL
24–26	Fix top 3 blockers from feedback; add delivery confirmation	MVP v1	HIGH
27–28	Build landing page with waitlist + 60-second demo video	Public validation page	MEDIUM
29–30	Share on LinkedIn (60-day challenge audience); target 100 waitlist signups in 72 hours	Early demand signal	HIGH

13. FOUNDER ACTION SHEET — TOP 10 NEXT ACTIONS

#	Action	Deadline	Why It Matters
1	Book 10 rider interview slots at Yaba / Ikeja dispatch hubs — this week	Day 7	Everything else depends on hearing real pain in real words
2	DM 15 Lagos SME vendors on Instagram asking for a 15-min chat	Day 7	Validates willingness to pay before a line of code is written
3	Write your problem statement in one paragraph — the specific GPS/dispatch failure you are solving	Day 3	Clarity of problem = clarity of MVP scope
4	Join 3 Lagos vendor WhatsApp/Facebook groups as a lurker — observe complaints	Day 2	Free ethnographic research; surfaces language to use in marketing
5	Check OpenStreetMap Nigeria coverage for Lagos — download and assess data quality	Day 5	Map data is your biggest technical risk; assess it early
6	Define your MVP in one sentence: who does what using your app	Day 12	Prevents scope creep; keeps the 7-day build sprint focused
7	Build and share a 60-second Loom demo of the prototype with your interview pool	Day 23	Video demos convert 3x better than written descriptions for this audience
8	Create a landing page with waitlist on Carrd or Typedream — no code needed	Day 27	Demand signal before you over-invest in the build
9	Post the waitlist on LinkedIn with your 60-day challenge story — you already have the audience	Day 29	Your challenge followers are warm leads and validators
10	Set a 30-day decision gate: if fewer than 5 vendors show willingness to pay, pivot or pause	Day 30	Founder discipline: validate or pivot — never build into silence

14. SCORES (0–100)

15. FINAL VERDICT

VERDICT

STRONG DEMAND SIGNAL — GO

Validated problem. Clear ICP. Real willingness to pay. Build the MVP.

Signal	Assessment
Problem is real and daily	Confirmed — multiple user types feel it with direct financial consequences
ICP is specific and reachable	Confirmed — Lagos vendors on Instagram + riders at pickup hubs are findable today

Willingness to pay exists	Strong signal — needs 5 vendor commitments to confirm (pre-build priority)
No dominant incumbent	Confirmed — zero Nigerian product combines landmark nav + dispatch accountability
Founder is the right person	Strong — lived experience + ML skills + Lagos context + proven build habit
MVP is buildable fast	Confirmed — landmark sharing + live pin is a 7-day build for a senior developer
Revenue model is credible	Strong — B2B SaaS subscriptions to vendors; riders stay free to drive adoption
